

CHAPTER XXV

**The No Boundary  
Condition**

**T**he no boundary condition is the idea that the Universe is finite (that it is not infinite) but it is not limited (has no boundaries) in imaginary time.

If we assign to the volume of the universe any given limit whatever, which is determined by the measure of the speed of light in imaginary time, we can have no answer that would explain the meaning of the “hypostasis of the universe”, that is, of its existence.

The universe is Infinite! The problem in the science of physics is that it does not explain to us “what infinity is” for the simple reason that it does not collaborate with philosophy which can explain it.

Many scientists believe that infinity is determined by the outward evolution of the universe despite the fact that this view generates the problem of the evolution of the “Void” in the interior of the universe (since the universe continuously empties inwardly).

Conventional science does not dare to think that the concept of evolution and the concept of involution are identical, the same, in the measure of a Golden Mean that “makes the universe exist forever.”

Evolution and Involution deal with the actions of the two hypostases of the Ether which acts simultaneously as Immobile and Mobile. Matter simultaneously with its energy, space and absolute space, are results of the Ether.

In the universe of the Ether, the science of physics must take into account that the position that it gives each “mental observer” to support the result of a hypothetical experiment, the Ether, which is nothing other than so-called spacetime, has within its structure both Motion and Immobility.

Only the equations which explain the velocities of light, the concept of time and space and the correlations of motion of the celestial bodies in relation to the “Constant background” of the Ether and its “potential” and “actual” dual nature can lend hypostasis to, that is to say, can constitute real events that will derive from the results of the equations.

The imaginary times and imaginary numbers in a practically indemonstrable time and space might benefit the equations on paper, but not humanity itself.

We do not have the right to claim that “the universe opens”, because the galaxies, which constitute 4-6% of the total matter that distances itself, while of the entirety of its remaining matter we are unable to determine its position and the trajectory of its particles by reason of Heisenberg’s Indeterminacy principle and also by reason of the uninvestigable dark matter that covers space.

The Ether is whatever is understood as Universe and Anti-Universe together!

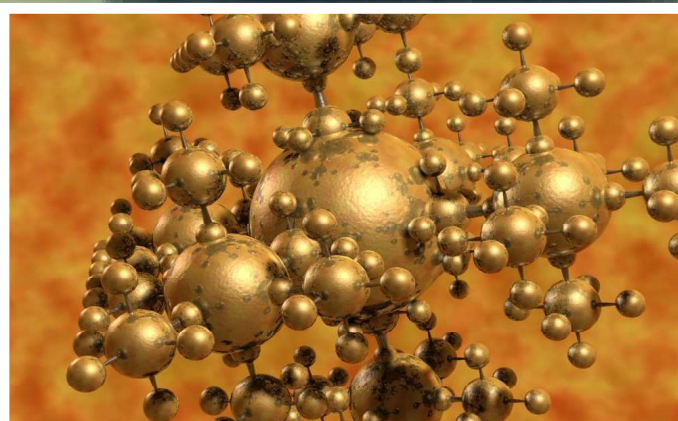

The Ether is the Spirit of matter and the matter of Spirit together!

The Ether is Space and Time, near and Far, Interior and Exterior, Void and Plenum, Part and Whole, Attraction and Repulsion, Entropy and order!

The Ether is the microcosm and macrocosm as common essence.

The Ether expresses Law in its Immobile and Mobile attribute.

The Ether constitutes the creation, Supervision, Evolution and involution of the Universal world.

The Ether is the “sum of sums” and no scientific theory or equation can have substance without it.

The no boundary condition, if it is identified with the concept of infinity, cannot have any probative force whatever!

If Infinity is the Void in which the Plenum is activated, we must explain what the plenum is and subsequently interpret the concepts of the “limit that is not infinite” and the ‘unlimited’ that has limits.

Infinity, which is nothing other than the Ether, consists of a quantity of nonintrinsic particles that move with endless speed equal to or greater than that of light, in every direction of a space made up of these same non-intrinsic particles.

These non-intrinsic infinitesimal particles form an isotropic mass, which is infinite in its indivisible substance and infinite in its divisibility.

Its indivisible state is Immobile, its divisible state, mobile. The Divisible generates the worlds of a universe that continuously opens with increasing velocities which finally lead to its absorption by its Immobile state.

## The Finite

While the infinite has no beginning or end, antithetically the finite is that which lies within a limit in relation to space, size, number, strength and duration.

In the sensible world, the finite and potentiality are the essence of all beings that are not self-substantiating.

In space-time reality, the finite is calculable but not measurable. Its beginning and its end are based on logical conclusion and calculation.

When a finite entity is determined and followed by its like, then the concept of finite is identical with the harmonious continuity of its genus, or kind, or condition.

**Evolution and Involution deal with the actions of the two hypostases of the Ether which acts simultaneously as Immobile and Mobile. Matter simultaneously with its energy, space and absolute space, are results of the Ether.**

Since, however, the matter of the universe has as its structural material the Ether itself, we then conclude that the Immobile Ether exhales and inhales the mobile, which is itself.

Therefore, the Ether has only itself as a measure of comparison.

The borders of absorption of the universe by the Immobile Ether, create the “limit which is not infinite”, while the Ether as infinite is “the indeterminate that has no limits”. However, the intervention of the marvelous Law of Proportions explains to us that the Minimal and The Infinite, the Divisible and the Indivisible, the Void and Plenum, are found one within the other.

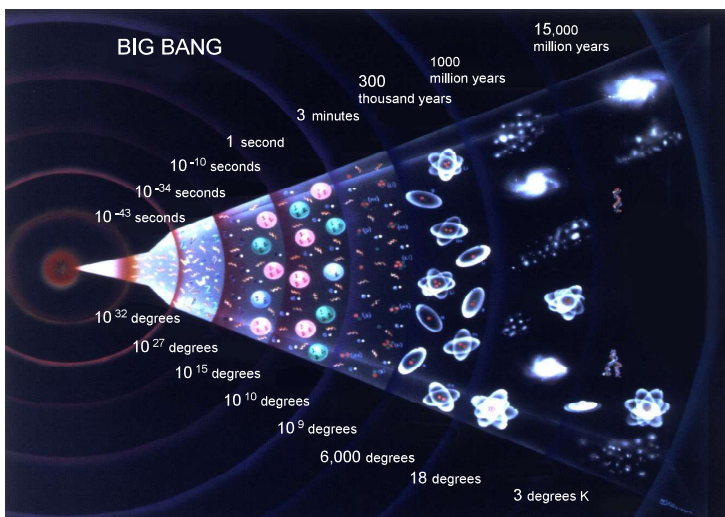

The quantum theory of gravity permits the possibility of there being no limit to spacetime, that is, the Ether, with the result that there is no need for us to determine the behavior of the Universe within a given limit.

The same theory assure us that there are no singularities, where the Laws of physics are abolished and there is no end to spacetime that will create the necessity for new laws that will define the minimal conditions of spacetime.

Steven Hawking refers laconically to this: “The minimal conditions of the Universe are that the universe has no limits.

The universe contains itself fully and is not affected by anything else whatever outside it! It is not created, nor destroyed. It simply exists.”

**We do not have the right to claim that “the universe opens”, because the galaxies, which constitute 4-6% of the total matter that distances itself ...**

Many scientists believe that infinity is determined by the outward evolution of the universe.

“The proposition of no boundary in spacetime (the Ether) which concerns the contemporary science of astrophysics” Hawking again explains, “leads to the prediction of a probability that the rate of expansion of the universe will be almost the same in all directions.

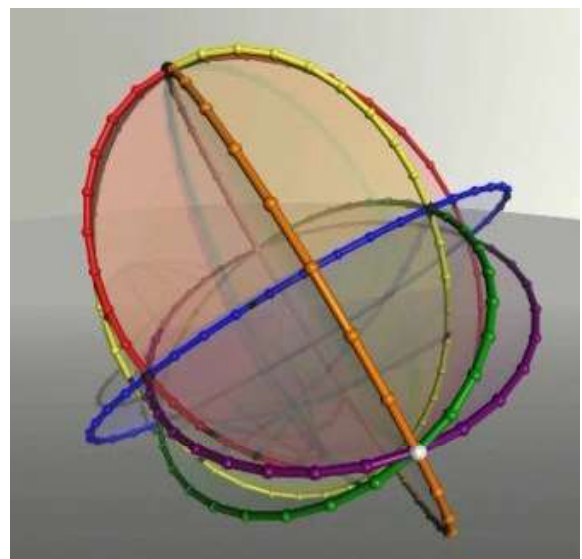

This prediction accords with scientific observations that show that the intensity of the diffuse microwave radiation is nearly always the same in every direction.

This statement documents the uniform behavior of the Ether, and supports the likewise uniform behavior of the expansion of the universe.

If the Ether were not uniform, the universe would have unequal boundaries of expansion and the intensity of the radiation that would come from these inequalities, would have also unequal shifts toward red.

All these things claimed by Professor Hawking are totally correct, if we consider “the universe is composed of Moving Ether within Immobile Ether.”

If the Universe is neither created nor destroyed, then of itself it is Self-generated, Complete, Consubstantial and Full, in the concept of Absolute Spirit.

The quantum theory of gravity permits the possibility of there being no limit to spacetime ...
